### **DEPARTMENT OF PUBLIC UTILITIES**

Petition of NSTAR Electric Company and)Western Massachusetts Electric Company)d/b/a Eversource Energy for Approval of their)Grid Modernization Plans)

D.P.U. 15-122/123

### **DIRECT TESTIMONY OF**

# MARGARET T. DOWNEY, AUSTIN T. BRANDT AND KEVIN F. GALLIGAN

## ON BEHALF OF

# THE CAPE LIGHT COMPACT

MARCH 10, 2017

D.P.U. 15-122/123 Exhibit CLC-DBG-1 March 10, 2017 Tina W. Chin/Sarah Herbert Page 1 of 17

# Q: Please state your name, title, business address, and provide a brief description of your responsibilities.

Downey: My name is Margaret T. Downey, and I am the Administrator for the 3 A: Cape Light Compact (the "Compact"). My business address is c/o Cape Light 4 5 Compact, Open Cape Building, 3195 Main Street, Barnstable, Massachusetts 02630. As Administrator, I oversee the administration of the Compact and its 6 development and implementation of its energy efficiency programs, as well as its 7 provision of competitive energy supply through its municipal aggregation program. 8 9 Specifically, I manage the Compact's activities as an electric energy efficiency program administrator ("PA") and as a municipal aggregator for residents and 10 11 businesses of Cape Cod and Martha's Vineyard. With respect to the Compact's 12 energy efficiency activities, I oversee the administration of the Compact's annual 13 energy efficiency program budgets that are part of the three-year statewide 14 Department of Public Utilities (the "Department") approved plan. I am responsible 15 for local and state regulatory reporting and approvals, as well as the oversight of the 16 participation and compliance in the ISO New England forward capacity market. I 17 represent the Compact as a non-voting member of the Energy Efficiency Advisory 18 Council, and regularly make presentations and report to customers, the Compact's 19 Governing Board ("Board"), staff, regulatory agencies and community advocates. 20 Brandt: My name is Austin T. Brandt. I am the Power Supply Planner for the Cape A:

21 Light Compact. My business address is c/o Cape Light Compact, Open Cape

22 Building, 3195 Main Street, Barnstable, Massachusetts 02630. I am responsible for

D.P.U. 15-122/123 Exhibit CLC-DBG-1 March 10, 2017 Tina W. Chin/Sarah Herbert Page 2 of 17

| 1  |    | the day-to-day management of the Compact's power supply program, and related       |
|----|----|--|
| 2  |    | duties. I am also the primary person responsible for the design and implementation |
| 3  |    | of the Compact's Demand Response Demonstration Offering ("Offering").              |
| 4  | A: | Galligan: My name is Kevin F. Galligan. I am the President of Galligan Energy      |
| 5  |    | Consulting, Inc. My business address is P.O. Box 1614, Orleans, MA 02653. I        |
| 6  |    | have over 35 years of energy industry experience and serve as a consultant for the |
| 7  |    | Compact, where I assist with energy efficiency program implementation and advise   |
| 8  |    | the Compact on certain regulatory matters. I also worked for the Cape Light        |
| 9  |    | Compact as Energy Efficiency Program Manager from 2002 to 2012, where I was        |
| 10 |    | the person responsible for supervising the implementation of the Compact's energy  |
| 11 |    | efficiency programs.   |
| 12 | Q: | What is the purpose of your testimony?   |
| 13 | A: | The purpose of our testimony is to describe the Compact and its programs, and to   |
| 14 |    | highlight how the grid modernization process, and specifically the deployment of   |
| 15 |    | advanced metering functionality ("AMF"), could enhance the Compact's               |
| 16 |    | implementation of its power supply, energy efficiency, and demand response         |
| 17 |    | programs.  |
| 18 | Q: | Please describe the Cape Light Compact.  |
| 19 | A: | The Compact is made up of the twenty-one towns and two counties of Cape Cod        |

20 and Martha's Vineyard. As the municipal aggregator for its member towns, the

21 Compact operates an opt-out retail power supply program in accordance with its

D.P.U. 15-122/123 Exhibit CLC-DBG-1 March 10, 2017 Tina W. Chin/Sarah Herbert Page 3 of 17

| 1  |    | approved Aggregation Plan, and administers energy efficiency programs in                |
|----|----|---|
| 2  |    | accordance with its approved Three-Year Energy Efficiency Plan. The Compact             |
| 3  |    | also represents the interests of its customers in regulatory and legislative matters at |
| 4  |    | the state level through advocacy and intervention in proceedings before the             |
| 5  |    | Department of Public Utilities (the "Department").                                      |
| 6  | Q: | Please describe the Compact's power supply program.                                     |
| 7  | A: | As the municipal aggregator for Cape Cod and Martha's Vineyard, the Compact             |
| 8  |    | provides all-requirements retail power supply on an opt-out basis to any customer       |
| 9  |    | within its service territory that opens a new account with the local electric           |
| 10 |    | distribution company ("EDC"). The Compact began its power supply program on a           |
| 11 |    | pilot basis in 2001, serving a relatively small number of customers. In early 2005,     |
| 12 |    | when Standard Offer expired, the Compact expanded its power supply program to           |
| 13 |    | include all customers within its aggregation territory. The Compact currently has       |
| 14 |    | approximately 135,000 of the 204,000 electric customers on Cape Cod and                 |
| 15 |    | Martha's Vineyard enrolled in its power supply program. Approximately 120,000           |
| 16 |    | of the Compact's power supply customers are residential customers. The Compact          |
| 17 |    | currently only offers fixed-price options for all rate classes to its power supply      |
| 18 |    | customers.  |
| 19 | Q: | Please describe the Compact's energy efficiency programs.                               |

A: Downey: As the municipal aggregator for Cape Cod and Martha's Vineyard, the
Compact is authorized under state law to operate approved energy efficiency

D.P.U. 15-122/123 Exhibit CLC-DBG-1 March 10, 2017 Tina W. Chin/Sarah Herbert Page 4 of 17

| 1 | programs within its service territory. Notably, the Compact is the only non-utility  |
|---|--|
| 2 | energy efficiency PA in Massachusetts, and therefore the only PA that does not also  |
| 3 | own the utility infrastructure serving the territory in which it operates its energy |
| 4 | efficiency programs. The Compact has been continuously administrating award-         |
| 5 | winning energy efficiency programs since 2001 that are tailored to the Compact's     |
| 6 | unique demographics and responsive to customer feedback. The Compact                 |
| 7 | administers energy efficiency programs for all customer classes, and to date has     |
| 8 | achieved \$800 million in lifetime savings for ratepayers on Cape Cod and Martha's   |
| 9 | Vineyard.  |

# 10 Q: Please describe the Compact's past and current behavioral and demand 11 response programs.

12 A: Galligan: In 2009, the Compact implemented a residential smart home energy 13 monitoring pilot program to evaluate the potential energy savings from in-home energy monitoring systems. The Compact was the first Massachusetts PA to design 14 and implement a smart home energy monitoring demonstration/pilot project that 15 included near-real-time, in-home, and computer-based display of energy usage for 16 17 customers to take actions, particularly at times of peak demand, to learn what was 18 driving their usage and take steps to reduce energy use. This pilot project not only 19 demonstrated a high level of customer engagement, satisfaction and significant 20 energy savings, but also confirmed the ability of a third-party provider to interface 21 with existing utility meters to accurately collect, present and analyze electric usage 22 data for participating customers.

D.P.U. 15-122/123 Exhibit CLC-DBG-1 March 10, 2017 Tina W. Chin/Sarah Herbert Page 5 of 17

| 1  |    | The Compact's Smart Home Energy Monitoring Pilot Program has received               |
|----|----|---|
| 2  |    | national recognition as a successful and effectively designed program. According    |
| 3  |    | to a report issued in April 2010 by independent evaluator, PA Consulting Group, the |
| 4  |    | Compact's 100 actively engaged pilot participants from Cape Cod and Martha's        |
| 5  |    | Vineyard reduced their daily energy use by 9.3 percent or 2.9 kilowatt-hours        |
| 6  |    | ("kWh") per day, the second highest decrease when compared to results from          |
| 7  |    | similar smart monitoring programs tested throughout North America. Seventy-five     |
| 8  |    | percent of program participants reduced energy consumption during the program.      |
| 9  |    | One-third reduced average energy consumption by 4 or more kWh per day. The          |
| 10 |    | American Council for an Energy-Efficient Economy ("ACEEE") used the                 |
| 11 |    | Compact's Smart Home Energy Monitoring Pilot Program as a case study in             |
| 12 |    | demonstrating that behavioral change by individual consumers can lead to            |
| 13 |    | significant energy and cost savings.  |
| 14 |    | Over the course of one year, the Compact's Smart Home Energy Monitoring Pilot       |
| 15 |    | Program participants conserved approximately 105,850 kWh of electricity, the        |
| 16 |    | equivalent of CO2 emissions saved by over 16 acres of pine forest or the            |
| 17 |    | greenhouse gas emissions avoided by recycling 25.6 tons of waste instead of         |
| 18 |    | sending it to the landfill.   |
| 19 | A: | Brandt: Over the past several years, the Compact's Smart Home Energy                |
| 20 |    | Monitoring Pilot Program evolved into its current Residential Behavior Feedback     |
| 21 |    | Initiative, which uses near-real-time energy monitoring hardware to encourage       |

D.P.U. 15-122/123 Exhibit CLC-DBG-1 March 10, 2017 Tina W. Chin/Sarah Herbert Page 6 of 17

| 1 | energy usage reduction through behavioral change by allowing participants to see      |
|---|---|
| 2 | how different actions (e.g., turning on a dehumidifier) have an impact on their usage |
| 3 | and electric bills.   |

The Compact also filed an Offering as an exhibit in its most recent Three-Year 4 5 Energy Efficiency Plan. This Offering is designed to reduce customer demand 6 through curtailment events and to encourage load-shifting through installation of 7 demand response technologies and behavioral changes. On the residential side, this 8 included installing energy monitoring equipment and WiFi thermostats in over 35 9 homes in 2016, allowing participants to view their energy usage and remotely adjust 10 their thermostats. The Compact called demand response events over the course of the summer, automatically adjusting most participants' thermostats to reduce 11 electric demand from their air conditioning units. The Offering included an 12 13 enrollment payment and a per kWh reduction payment, measured retroactively for 14 all events. See Exhibit CLC-DBG-2.

In 2017 and 2018, the Compact plans to expand the residential thermostat component by enrolling more participants but will discontinue installations of nearreal-time energy monitoring equipment for future participants, as such equipment is cost-prohibitive. The Compact also plans to file a mid-term modification to its Three-Year Energy Efficiency Plan with the Department in March 2017 to expand the Offering by adding a load-shifting thermal storage component for small-tomedium commercial customers. The thermal storage technology will mitigate

D.P.U. 15-122/123 Exhibit CLC-DBG-1 March 10, 2017 Tina W. Chin/Sarah Herbert Page 7 of 17

| 1  |    | summer peaks largely caused by air conditioning load without impacting customers'    |
|----|----|--|
| 2  |    | comfort. The Compact will be recruiting a small number of customers to               |
| 3  |    | participate.   |
| 4  |    | Along with other PAs, the Compact plans to use the collective results of the PAs'    |
| 5  |    | demand response demonstration offerings to inform a potential expansion of           |
| 6  |    | demand response programs in the 2019-2021 Statewide Energy Efficiency Plan.          |
| 7  | Q: | How does grid modernization intersect with the Compact's operation of its            |
| 8  |    | power supply, energy efficiency, and demand response programs, as described          |
| 9  |    | above?   |
| 10 | A: | Brandt: As laid out by the Department in its Order issued on June 12, 2014 in        |
| 11 |    | D.P.U. 12-76-B ("Order 12-76-B"), the primary customer-facing component of grid      |
| 12 |    | modernization that intersects with the Compact's operation of its power supply,      |
| 13 |    | energy efficiency, and demand response programs is the deployment of AMF.            |
| 14 | Q: | What is your understanding of "the deployment of AMF" in this proceeding?            |
| 15 | A: | In Order 12-76-B (at 48), the Department declined to adopt an opt-in approach to     |
| 16 |    | advanced metering infrastructure and instead required that each EDC file opt-out     |
| 17 |    | proposals and opt-out tariffs. EDCs were instructed to file grid modernization plans |
| 18 |    | ("GMPs") designed to achieve the roll-out of AMF within five years of approval of    |
| 19 |    | their GMPs, or make a business case that demonstrates that a longer timeframe is a   |
| 20 |    | superior approach. As defined by the Department, AMF includes four main              |
| 21 |    | functions: (1) the collection of customers' interval usage data, in near-real-time,  |

D.P.U. 15-122/123 Exhibit CLC-DBG-1 March 10, 2017 Tina W. Chin/Sarah Herbert Page 8 of 17

| 1  |    | usable for settlement in the ISO New England energy and ancillary services         |
|----|----|--|
| 2  |    | markets; (2) automated outage and restoration notification; (3) two-way            |
| 3  |    | communication between customers and the EDC; and (4) communication with and        |
| 4  |    | control of household appliances, with customers' permission. See Order 12-76-B at  |
| 5  |    | 3 n.1.   |
| -  | 0  |  |
| 6  | Q: | Based on that description, how does AMF have the potential to impact the           |
| 7  |    | Compact's operation of its power supply program?                                   |
| 8  | A: | Brandt: The widespread installation of AMF meters would have major implications    |
| 9  |    | for the Compact's operation of its power supply program. If most customers         |
| 10 |    | (across all rate classes) had AMF meters, the Compact would be able to offer its   |
| 11 |    | customers time varying rate ("TVR") power supply product options, including time-  |
| 12 |    | of-use ("TOU") pricing, critical peak pricing ("CPP"), peak time rebates ("PTR"),  |
| 13 |    | and real time pricing ("RTP"). In addition to the fixed-price product that is      |
| 14 |    | currently the default product, these power supply offerings would provide Compact  |
| 15 |    | power supply customers a wide range of choices.                                    |
| 16 | 0. | How does AME metaring have the notantial to impact sustamore' never supply         |
| 10 | Q. | now does Alvir metering have the potential to impact customers power suppry        |
| 17 |    | choices and pricing?   |
| 18 | A: | Brandt: The ability of advanced meters to collect and communicate near-real-time   |
| 19 |    | interval-level usage data to customers would enable customers to more thoroughly   |
| 20 |    | understand their energy usage patterns. This insight into their energy usage would |
| 21 |    | allow customers to evaluate the wide range of power supply products available to   |

D.P.U. 15-122/123 Exhibit CLC-DBG-1 March 10, 2017 Tina W. Chin/Sarah Herbert Page 9 of 17

| 1  |                 | them, either through the Compact's power supply program or from competitive   |
|--|-----------------|---|
| 2  |                 | suppliers. As a result, customers could choose a plan that suits their individual   |
| 3  |                 | energy needs and lifestyles and affords them the best opportunities to save money   |
| 4  |                 | on their bills through usage reduction and/or load shifting to less expensive periods.  |
|  |                 |   |
| 5  |                 | The Compact could also investigate how to best utilize these power supply products  |
| 6  |                 | to provide financial benefits beyond the individual customer. For instance, by  |
| 7  |                 | enrolling a significant number of power supply customers in a CPP or PTR plan, the  |
| 8  |                 | Compact may be able to reduce supply costs for all Compact power supply   |
| 9  |                 | customers by reducing capacity costs through capacity tag management, and/or  |
| 10   |                 | shifting energy usage to off-peak periods.  |
|  |                 |   |
| 11   | Q:              | Are there any other elements of the grid modernization order(s) that impact   |
| 11<br>12   | Q:              | Are there any other elements of the grid modernization order(s) that impact the Compact's operation of its power supply program?  |

| <ol> <li>11</li> <li>12</li> <li>13</li> <li>14</li> <li>15</li> <li>16</li> <li>17</li> <li>18</li> <li>19</li> <li>20</li> </ol> | <b>Q:</b><br>A: | Are there any other elements of the grid modernization order(s) that impact<br>the Compact's operation of its power supply program?<br>Brandt: Other than the metering deployment, a key element of the grid<br>modernization process will be the ability for third-party suppliers, including the<br>Compact's power supplier, to access the interval-level metering data in a reasonable<br>manner and timeframe. In Order 12-76-B (at 36), the Department recognized that<br>'meter data access for third parties is an important component of maintaining and<br>supporting the competitive electricity market'' and ordered that GMPs address<br>''procedures for allowing an authorized third party to access customer usage data |

D.P.U. 15-122/123 Exhibit CLC-DBG-1 March 10, 2017 Tina W. Chin/Sarah Herbert Page 10 of 17

| 1  | customer." These issues are critically important to the Compact. If data is truly    |
|----|--|
| 2  | accessible to third parties, it will enhance the Compact's power supply program,     |
| 3  | whereas if data is inaccessible or not timely provided to third parties, then the    |
| 4  | Compact would not be able to provide a TVR power supply product that utilizes the    |
| 5  | advanced meter infrastructure to advance the demand optimization goal of grid        |
| 6  | modernization that was set forth by the Department. In addition, forcing customers   |
| 7  | to enroll in basic service in order to have a TVR power supply product               |
| 8  | disadvantages the Compact in competing with basic service. Without access to the     |
| 9  | interval-level metering data, the suppliers would not be able to offer TVR products, |
| 10 | despite the ability of the meter to collect the necessary data.                      |
| 11 | The ability of competitive suppliers to offer TVR-based power supply products and    |
| 12 | leverage associated customer-specific and program-wide benefits is based on the      |
| 13 | assumption that the necessary metering infrastructure is deployed on a widespread    |
| 14 | basis, as is laid out in the Department's grid modernization orders. Competitive     |
| 15 | suppliers require access to customers' energy usage data in order to develop         |
| 16 | competitively priced offers and communicate savings opportunities in real time to    |
| 17 | the customers who participate in their programs.                                     |
|    |  |

18 Q: How does AMF have the potential to impact the Compact's operation of its
19 energy efficiency programs?

20 A: Downey: AMF data of customers across Massachusetts would be of great value to

21 the Compact when developing its energy efficiency plans. As mentioned

D.P.U. 15-122/123 Exhibit CLC-DBG-1 March 10, 2017 Tina W. Chin/Sarah Herbert Page 11 of 17

| 1  |    | previously, the Compact makes concerted efforts to tailor its energy efficiency      |
|----|----|--|
| 2  |    | programs to its customer base on Cape Cod and Martha's Vineyard. Access to           |
| 3  |    | interval-level metering data for the Compact's customers (of all rate classes) would |
| 4  |    | give the Compact a deeper understanding of how the usage patterns of customers       |
| 5  |    | may differ both within the Compact's service territory and as compared with areas    |
| 6  |    | outside of the Compact's service territory that are served by other PAs. Such data   |
| 7  |    | would allow the Compact to better estimate energy savings potential and better       |
| 8  |    | tailor its program for Cape Cod and Martha's Vineyard customers.                     |
| 9  | A: | Galligan: For example, Eversource has testified in connection with its pending rate  |
| 10 |    | case proceeding, D.P.U. 17-05, Exhibit ES-GMBC-1 at 45, "[i]n most areas of the      |
| 11 |    | Eversource service territory the peak is between 2PM and 6PM during a weekday        |
| 12 |    | afternoon. In southeastern MA, the peak most likely occurs between 5PM and 8PM       |
| 13 |    | potentially even on the weekend." Given that Eversource's data is currently          |
| 14 |    | substation based and not at a customer level, advanced metering data would provide   |
| 15 |    | a richer data set that would allow the Compact to understand at a more nuanced       |

16 level what the real drivers of demand are and how they relate to Massachusetts'

17 diverse communities. With this data, the Compact could better understand how

customers on Cape Cod and Martha's Vineyard contribute to the system-wide load
and energy markets throughout Eversource's eastern territory (referred to as

20 "Eversource East" in D.P.U. 17-05). The Compact would apply the lessons it learns

21 to develop more cost-effective customer-driven solutions for optimizing demand.

D.P.U. 15-122/123 Exhibit CLC-DBG-1 March 10, 2017 Tina W. Chin/Sarah Herbert Page 12 of 17

| 1  | A: | Downey: For its residential energy efficiency programs, interval-level metering      |
|----|----|--|
| 2  |    | data could help inform program design by allowing the Compact (and other PAs) to     |
| 3  |    | better evaluate the effectiveness (at reducing energy usage and/or peak demand) of   |
| 4  |    | certain installed measures. For small-to-medium commercial customers this impact     |
| 5  |    | may be amplified, as the Compact and its vendors often work one-on-one with these    |
| 6  |    | customers to implement energy conservation measures ("ECMs") that are tailored       |
| 7  |    | to the customer on a building-by-building basis. Interval-level usage data for these |
| 8  |    | small-to-medium commercial customers would be a powerful tool to assess usage        |
| 9  |    | patterns, pinpoint ECMs that would be most effective, and evaluate savings.          |
| 10 |    | Additionally, the availability of this information and education on customer choice  |
| 11 |    | could spur a market for controllable devices designed to manage energy usage,        |
| 12 |    | which may have the ability to dispatch based on pricing information directly from    |
| 13 |    | the AMF meter. Leveraging these devices to achieve energy savings could be           |
| 14 |    | beneficial for the continued success of the energy efficiency programs.              |
| 15 |    | As with power supply, these advantages are dependent on widespread deployment        |
| 16 |    | of AMF meters.   |
| 17 | Q: | How does AMF metering have the potential to impact the Compact's operation           |
| 18 |    | of its behavioral and demand response programs?                                      |
| 19 | A: | Brandt: Interval metering and near-real-time reporting are essential to encouraging  |
| 20 |    | load shifting through behavioral change and accurately measuring demand              |
| 21 |    | reductions achieved through demand response events, which is the reason that the     |

D.P.U. 15-122/123 Exhibit CLC-DBG-1 March 10, 2017 Tina W. Chin/Sarah Herbert Page 13 of 17

| 1  | Compact deployed near-real time interval metering technology for participants in its |
|----|--|
| 2  | behavioral and demand response programs. However, the cost and difficulties          |
| 3  | associated with installing the metering technology and maintaining connectivity are  |
| 4  | a significant part of the reason that the Compact has stopped enrolling new behavior |
| 5  | initiative participants and does not plan to deploy metering technology on Offering  |
| 6  | participants. Having advanced metering infrastructure in place with the ability to   |
| 7  | communicate interval-level usage data with customers in near-real time would         |
| 8  | eliminate the need for expensive workaround energy monitoring equipment that the     |
| 9  | Compact has deployed as a workaround for interval meters in the past through its     |
| 10 | Behavior Feedback Core Initiative and Offering. The monitoring equipment used        |
| 11 | as part of its Offering costs several hundred dollars to purchase, and requires an   |
| 12 | electrician to install, adding to the total cost. AMF deployed on a widespread basis |
| 13 | would provide a solution to this problem, and enable a more cost-effective approach  |
| 14 | to future demand response and behavioral programs across Massachusetts.              |
| 15 | Besides enabling expanded and more cost-effective behavioral and demand              |
| 16 | response programs, AMF metering capability could also impact enrollment in these     |
| 17 | programs by allowing for a more straightforward and efficient disbursement of        |
| 18 | participation incentives. This could be achieved by coupling participation in the    |
| 19 | program with a TVR power supply product (also enabled by AMF metering) that          |
| 20 | would allow the incentive to directly appear on the monthly bill, in the form of a   |
| 21 | peak time rebate or reduced on-peak energy charges. Not only does this create        |

D.P.U. 15-122/123 Exhibit CLC-DBG-1 March 10, 2017 Tina W. Chin/Sarah Herbert Page 14 of 17

| 1 | enhanced customer incentive to reduce or shift load, but it also makes for a         |
|---|--|
| 2 | smoother customer experience and more effective program implementation than, for     |
| 3 | instance, issuing one or multiple per-kWh reduction incentive checks to participants |
| 4 | as the Compact does now, after the event or cooling season is over.                  |

### 5 Q: Does AMF relate to your demand response offerings?

6 A: Brandt: Widespread AMF has the potential to make demand response a much more powerful resource for reducing demand and changing customers' behavior. As 7 8 described above and illustrated through the Compact's Behavior Feedback Initiative 9 and Offering, access to near-real-time, interval-level energy usage data provides 10 customers with information that they can use to better manage their electric loads, 11 especially in response to time-varying price signals. This allows customers to make changes that, when aggregated, could provide significant system benefits in the 12 13 form of demand reductions during specific times.

14 The incentive for the customers to make a behavioral change to reduce their

15 demand at certain times could be pricing signals through a TVR offering (e.g., a

16 peak time rebate for reductions during peak periods). The AMF meter would

17 provide both the capability to offer a TVR power supply product and the ability for

- 18 the meter to send pricing signals to the customer and/or the customer's load
- 19 management connected devices.

D.P.U. 15-122/123 Exhibit CLC-DBG-1 March 10, 2017 Tina W. Chin/Sarah Herbert Page 15 of 17

| 1  |    | More specifically, the ability to offer a TVR pricing plan will increase customer     |
|----|----|---|
| 2  |    | value for participants with load shifting technology (such as participants in the     |
| 3  |    | Compact's proposed thermal storage offering) and encourage increased                  |
| 4  |    | participation in future demand response and load shifting programs, which results in  |
| 5  |    | associated benefits from reduction in peak demand, including demand optimization      |
| 6  |    | and possibly the deferment of infrastructure upgrades associated with peak demand     |
| 7  |    | growth.   |
| 8  |    | This combination of near-real-time, interval-level usage information and ability for  |
| 9  |    | the customer to have a TVR both allows and motivates the customer to play a role      |
| 10 |    | in optimizing system demand, and so the Compact would like to leverage that           |
| 11 |    | added-value to scale up its demand response initiatives.                              |
| 12 | Q: | Are there other benefits from AMF that are related to the implementation of           |
| 13 |    | energy efficiency and demand response programs?                                       |
| 14 | A: | Galligan: Perhaps one of the most important advantages that could be provided by      |
| 15 |    | customer-specific interval-level metering data for all customer classes would be the  |
| 16 |    | ability to better geo-target energy efficiency and demand response programs to        |
| 17 |    | provide both grid-facing and customer-facing benefits that could potentially reduce   |
| 18 |    | customer costs associated with distribution infrastructure. For example, if the       |
| 19 |    | Compact were provided interval level metering data for all customers, the Compact     |
| 20 |    | would be able to more effectively reduce peak loads by targeting the specific         |
| 21 |    | customers that are contributing the most to those loads. If coupled with feeder-level |

D.P.U. 15-122/123 Exhibit CLC-DBG-1 March 10, 2017 Tina W. Chin/Sarah Herbert Page 16 of 17

| 1  |    | data from the EDC, this could enable the Compact to geo-target energy efficiency    |
|----|----|---|
| 2  |    | and demand response customers in such a way that it could potentially defer         |
| 3  |    | expensive upgrades to the distribution system, which are borne by all ratepayers.   |
| 4  |    | As the PA for Cape Cod and Martha's Vineyard, energy efficiency and demand          |
| 5  |    | response program design and implementation rests with the Compact, rather than      |
| 6  |    | the EDC – a unique situation in Massachusetts, as noted above. As such,             |
| 7  |    | Eversource was strongly encouraged as part of the Department's approval of the      |
| 8  |    | Mashpee substation expansion and upgrades (D.P.U. 14-03 at 20 (April 13, 2015))     |
| 9  |    | to work with the Compact in order to leverage the Compact's energy efficiency and   |
| 10 |    | demand response programs to alleviate the need for infrastructure upgrades, thereby |
| 11 |    | benefiting all distribution customers.  |
| 12 |    | These potential program benefits include customer-facing and grid-facing benefits   |
| 13 |    | but rely on widespread deployment of AMF meters. As the Compact has                 |
| 14 |    | demonstrated with the success of programs like the Smart Home Energy Monitoring     |
| 15 |    | Pilot Program (and others), customers on Cape Cod and Martha's Vineyard are         |
| 16 |    | eager to participate and be involved in energy efficiency and demand response       |
| 17 |    | solutions as part of a modern, reliable and efficient power system.                 |
| 18 | A: | Downey: To add to Mr. Galligan's last point, the Compact has investigated           |
| 19 |    | customer engagement through its Behavior Feedback Core Initiative. The Compact      |
| 20 |    | retained independent consultants to evaluate customers' experiences and feedback    |
| 21 |    | as part of this initiative, and the Compact has presented the results to the        |
|    |    |   |

D.P.U. 15-122/123 Exhibit CLC-DBG-1 March 10, 2017 Tina W. Chin/Sarah Herbert Page 17 of 17

| 1 | Massachusetts PAs and the Energy Efficiency Advisory Council. The Compact         |
|---|---|
| 2 | found high levels of customer interest in monitoring energy use and motivation to |
| 3 | save energy. In my personal experience, I have observed that many residential     |
| 4 | customers on Cape Cod and Martha's Vineyard want to be able to better track their |
| 5 | energy use and to take advantage of opportunities to save money on their energy   |
| 6 | bills.  |

# 7 Q: Does this conclude your testimony?

8 A: Yes, it does.
